Interactive Executive Presentation Experience

Cinematic HTML | Motion Design | Technical Storytelling | Interactive Prototyping

THE CHALLENGE

Pitch a **new fictional business opportunity or technology project** to a senior executive investment committee through an immersive, **interactive HTML presentation**. We expect a memorable, polished story with purposeful animation, live exploration and meaningful audience participation. The deliverable must work **fully offline by opening index.html**, with **no server, login, installation or internet connection**. We value technical ownership, **not an AI-generated presentation that you cannot explain or modify.**

ASSESSMENT ITEM	EXPECTATION
Technical format	HTML5, CSS3 and JavaScript. **Third-party JavaScript libraries are welcome**, provided runtime dependencies are included locally.
Deployment	**Standalone offline ZIP**. A reviewer must double-click **index.html** and use all core features immediately in a current Chrome or Edge browser.

1 Select one fictional business proposal

Choose **one** of the following topics. You may invent a project name, visual identity, fictional organization, market and reasonable cost estimates. The suggested visual angles are **inspiration, not templates**. A similarly ambitious alternative may be used with prior agreement from the interview panel.

OPTION	BUSINESS PROPOSAL	VISUAL / INTERACTIVE OPPORTUNITY
A | AeroBridge	A regional autonomous logistics network that moves essential medical supplies and urgent deliveries between hubs, clinics and remote communities.	Animated routes, 3D or 2D fleet movement, hub selection and travel-time or capacity simulation.
B | MetroPulse	A digital-twin command centre for city infrastructure, integrating transport, utilities, incidents and predictive maintenance.	Layered city map, network-flow animations, asset hotspots and live incident-response scenarios.
C | GridNova	An intelligent microgrid platform combining solar, batteries and demand optimization for industrial or campus operators.	Power-flow animation, day/night state, demand/load simulator and operational savings model.
D | OceanSense	A coastal resilience and environmental monitoring network using sensors, analytics and coordinated field response.	Dynamic coastline or abstract map, weather/water layers, sensor alerts and response-path scenario.

2 Tell an executive story, not a generic slideshow

All project facts must be fictional and clearly marked as illustrative assumptions; confidential data must not be used. Build an immersive narrative with approximately 8 to 10 distinct, deliberately art-directed scenes. The flow below is a suggested narrative. You may combine or reorder scenes if the executive story remains complete.

SCENE	NARRATIVE PURPOSE	EXPECTED EXPERIENCE
01 Cinematic opening	Fictional identity, vision and attention-grabbing proposition.	Memorable reveal, carefully sequenced typography, sense of depth and a clear opening hook.

SCENE	NARRATIVE PURPOSE	EXPECTED EXPERIENCE
02 The problem	Demonstrate current business pain, scale and urgency.	Data-led storytelling, visual before-state or animated operational consequence.
03 The opportunity	Define target users, benefits and measurable outcomes.	A spatial or animated overview rather than bullet-heavy slides.
04 The system	Explain the solution architecture and key capabilities.	A meaningful animated process, network or layered system diagram with selectable details.
05 A real use case	Show the sequence from trigger to business outcome.	Interactive journey with visual state changes, stages or scenario branching.
06 Capability showcase	Highlight the differentiating technologies or operating model.	Distinct kinetic, spatial, SVG, canvas or 3D sequences aligned to the story.
07 **Interactive simulator**	Let the executive change a decision variable and see the impact.	**Live computed** visualization + KPI response to slider/toggle/selection, not a pre-recorded video.
08 The business case	Communicate indicative investment, costs, savings, value and assumptions.	Animated financial/benefit visualization, with transparent fictional assumptions.
09 Roadmap & decision	Show phases, milestones, risks and the decision requested.	Animated timeline or rollout; strong closing frame and explicit executive ask.

CREATIVE DIRECTION

Aim for a **premium executive experience**, closer to an interactive product launch, cinematic innovation proposal or guided simulation than a traditional deck. **Do not submit ordinary static cards with fade-in effects, a converted PowerPoint or a pre-recorded video masquerading as interaction.**

3 Animation, visual effects and motion engineering

3.1 Required animation craftsmanship

- **Purposeful scene transitions:** Every scene should enter and exit smoothly. At least **three transitions** must have deliberate composition and sequencing, beyond a generic full-screen fade.
- **Kinetic typography:** Use animated words, numbers or statements to communicate meaning. Timing and hierarchy must reinforce the business narrative.
- **Animated system visualization:** Include at least one coherent animated network, timeline, route, layered diagram, map, data flow or other topic-relevant mechanism.
- **Cross-scene continuity:** At least one visual element, route, shape or focal object should **persist or transform between two scenes** to support the story.
- **Motion variety:** Demonstrate at least **three distinct motion techniques** (for example, SVG path drawing, camera/parallax, coordinated element choreography, morphing, particle systems or 3D). A library name by itself is not evidence.
- **Presentation control:** Animations must be paced for live narration, support replay/revisit and avoid disruptive auto-advancement. Offer a reduced-motion or pause option for essential looping visuals.

3.2 Visual design and assets

- Use a consistent design language with **strong typography, legible information hierarchy, restrained color, intentional spacing and visual continuity**.
- Develop topic-appropriate visuals. **Images, videos, SVG artwork, sound, WebGL scenes, 3D models and AI-generated illustrations** are permitted when used responsibly and packaged locally.
- At least **two scenes** should have a distinctive visual treatment, for example an animated perspective map, cinematic technical diagram, responsive 3D environment or highly polished infographic.
- Depth, lighting, texture and motion should enhance understanding. Avoid ornamental effects that consume time but explain nothing.
- Etisalat branding is **not required for the fictional presentation**. You may create a completely original fictional brand; do not imply endorsement by real organizations.

3.3 Meaningful interaction requirements

- **One live, data-driven simulator:** At least **two inputs** must modify visible numerical or spatial results and at least **one KPI or chart** must update through real client-side logic. Example: fleet size and route distance changing estimated time/cost.
- **One exploratory interaction:** Select a hotspot, component, route, layer, milestone or object to display additional context, a focused animation or linked detail.
- **One controlled comparison or scenario change:** Before/after, current/future, day/night, normal/incident or alternate rollout, with a clear and visibly meaningful outcome.
- **Integrated presenter navigation:** Next/Previous controls, keyboard navigation, visible progress/scene location and a reliable way to return to the opening or resume a scene. Navigation buttons alone are **not** counted toward the interactions above.

ILLUSTRATIVE SIMULATOR IDEA

For **GridNova**, a demand slider and battery-capacity selector might update simulated grid reliance, energy costs and animated energy flows. For **AeroBridge**, fleet size and mission distance might update mission capacity, cost and route intensity. The model can be simplified, but the **calculation, assumptions and visual state must be explainable**.

4 Standalone implementation and technical standards

4.1 Offline execution is mandatory

- **No server of any kind is needed to view or present.** Opening **index.html** directly from an extracted folder using a **file:// URL** must load the complete experience.
- **No internet at runtime:** Bundle fonts, images, videos, JavaScript, CSS, model files and any dependencies into the ZIP, or embed them. Do not rely on CDNs, API requests. Maps can be called through API or by any other mean.
- **Third-party JavaScript libraries are explicitly encouraged when useful.** Examples include GSAP, Three.js, Anime.js, D3, Lottie, PixiJS and other suitable tools. Keep the final deliverable license-compliant and runnable offline.
- A development build process is allowed, but the **viewer must not run npm, start a localhost server, install packages or execute scripts** to see the finished presentation.
- Test the delivered build after disconnecting from the internet. Pay attention to **ES module, fetch, font, WebGL texture and asset-loading restrictions under file://**. Provide a genuinely functional offline build.

4.2 Presenter experience and reliability

- Target a **16:9 executive presentation canvas**, with graceful scaling at **1920 x 1080** and **1366 x 768**. No illegible typography or clipped critical content.
- Include appropriate **loading/preloading behavior** if assets are substantial; there must be no blank white flashes or severe image pop-in during scene transitions.
- Ensure animations are smooth, controllable and recoverable. No stuck transitions, broken back-navigation, runaway loops or unexpected loss of simulator state.
- Support an unobstructed **full-screen or presentation mode** where browser permission allows, with intuitive exit and navigation. Do not hide crucial controls permanently.
- Clean browser-console behavior, intentional event cleanup, reasonable loading speed and graceful fallbacks if sophisticated effects are not available.
- Provide readable source modules/functions, sensible comments for complex animation choreography and **clear separation of scene state from DOM effects**.

4.3 Source ownership and use of AI

AI assistance is encouraged for ideation, storyboarding, asset prompting, animation, JavaScript, debugging and performance improvement. You must demonstrate independent engineering judgment, not simply accept whatever the AI produces.

- Show **at least three meaningful AI prompt iterations** in a short development log. Include the goal, prompt/approach, original output issue, your refinement and your independent verification.
- Identify **one actual technical or design weakness** in an AI suggestion and explain how you corrected it.
- Be prepared to explain the scene controller, animation sequencing, lifecycle of interactive state, client-side calculations and offline packaging.
- **A visually impressive but unexplained AI-generated artifact will score poorly.** You must be able to modify your own presentation live.

5 Submission requirements and interview

SUBMISSION	WHAT TO INCLUDE
01 Deliverable ZIP	A clean folder with **index.html** at its root and all local dependencies. The final presentation must open offline via double-click.
02 Editable source	HTML, CSS, JS and project files. If minified/bundled, include original source and optional build notes.

FINAL STANDARD | We value cinematic art direction, executive clarity, purposeful motion, real interactivity and independent technical ownership. The finished experience must work offline and you must be able to explain and modify the implementation. Paid tools and backend services are not required.
